

DEPURECO INDUSTRIAL VACUUMS SRL

CORSO VENEZIA, 32 - 10088 VOLPIANO (TO) ITALIA TEL. +39 011 98.59.117 FAX. +39 011 98.59.326 C.F. E P.I. 02258610357 DEPURECO@DEPURECO.COM WWW.DEPURECO.COM

The European Union adopted two European directives in regard to health and safety, known as ATEX 2014/34/UE (also ATEX 114) and ATEX 99/92/CE (also ATEX 137 or ATEX 153), concerning the risk of the existence of potentially explosives atmospheres.

2014/34/EU for the regulation of those devices to be used in zones where a risk of explosion exists; the directive points at those manufacturers of equipment intended for use in areas with potentially explosive atmospheres and at an obligation to certify these products; Directive 94/9/CE was cancelled and replaced effectively from 20 April 2016;

99/92/CE for the workers safety and health in explosive atmospheres; it is applied to those environments where a risk of explosion exists, where installations and certified tooling is used and it is consequently addressed to the users.

ATEX ZONES CLASSIFICATION

EXPLOSION PENTAGON

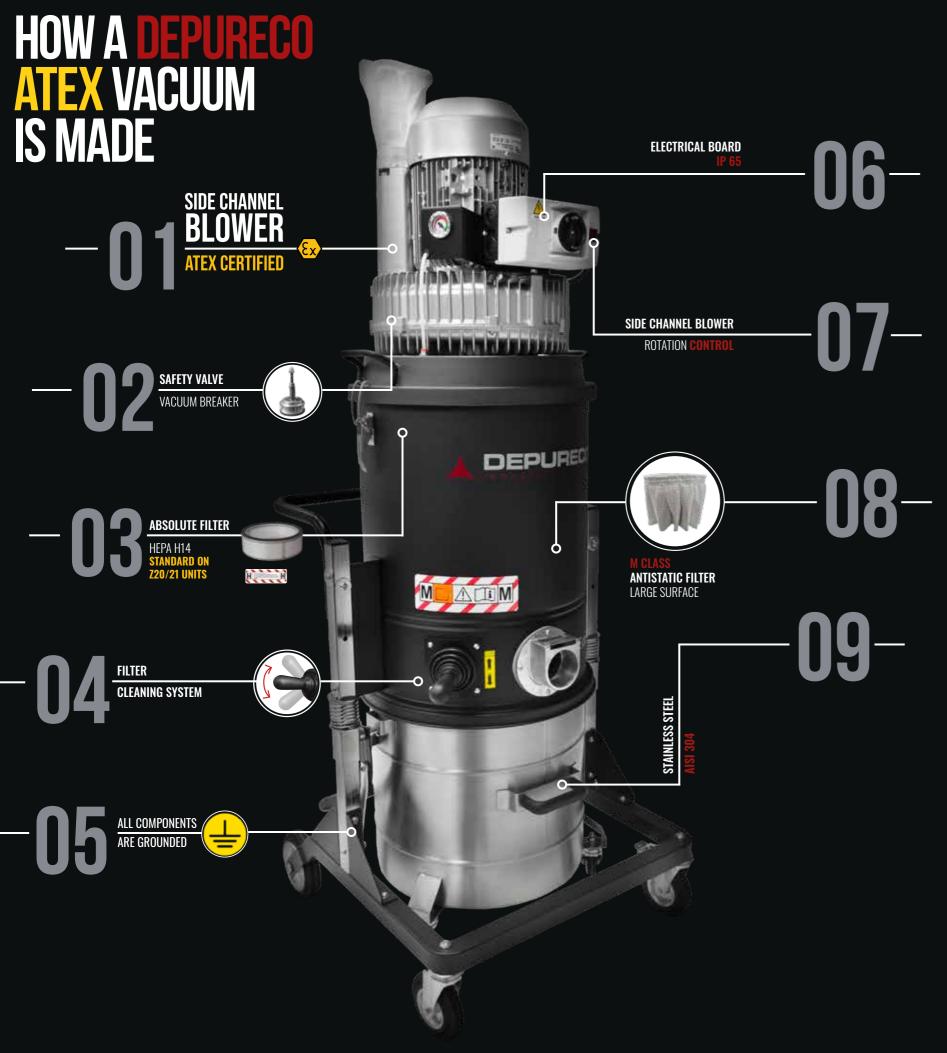

Just like the fire triangle, that represents the flammability conditions (and of consequent explosion), for liquid and gaseous combustibles, it is common to refer to "the explosion pentagon" when it comes to dusts as well as gases, vapours and mists.

The five conditions represented in the pentagon of the explosions, and necessary to create the conditions for an explosion are:

- PRESENCE OF A COMBUSTION AGENT IN THE ENVIRONMENT
- **DELIMITED ENVIRONMENT**
- MIXING OF REAGENTS

SUITABLE ACCESSORIES FOR ATEX APPLICATIONS

AN ACCESSORY, TO BE USED IN AN ATEX CLASSIFIED ENVIRONMENT, MUST BE ABLE TO ELECTRICALLY CONDUCT ALL ELECTROSTATIC CHARGES THAT MAY ARISE DURING THE SUCTION PROCESS. THE RESISTIVITY, EXPRESSED IN 10 Ω , OF THE MATERIALS USED IN THE ACCESSORIES CHARACTERIZES THEIR ABILITY TO DISCHARGE ELECTROSTATIC ENERGY.

FLEXIBLE TUBES

ELECTROCONDUCTIVE "EVA" Ø 40 - Ø 50 MM

Made of permanent electroconductive material $\leq 10 \Omega$ Ohm / meter. Lightweighted, extremely flexible even at low temperatures. Resistant to hydrolysis, microbiotic attacks and UV rays

ANTISTATIC POLYURETHANE Ø 40 - Ø 50 - Ø 70 - Ø 100 MM

Made of antistatic polyurethane with copper helicoid $\leq 10 \Omega$ Ohm / meter, in accordance with ATEX 2014/34 / EU (1999/92 / EC). Its resistance makes it ideal for applications in the ATEX area, where the material to be vacuumed is abrasive and / or aggressive.

ANTISTATIC ACCESSORIES

SYSTEMS

DISCHARGE

30

ROTATING **LEVEL SENSOR**

Automatic discharge system with 150 or 250 mm diameter double electro-pneumatic butterfly valve. It allows the material to be discharged from the hopper cone without stopping the suction.

II 2/3D Ex h IIIB T100°C Db/DcX

Manual discharge butterfly valve available in 150 mm and 250 mm diameter.

Automatic discharge system with flap and counterweight. When the vacuum cleaner is switched off, the weight of the material opens the flap discharging the hopper.

ATEX certified rotary valve for continuous hopper discharge.

II 1/3D Ex c T135°C

Motorised 24V low voltage sensor with rotating blade, ATEX Z21 certified. Useful to detect when the bin/hopper is full.

Ex II II 1/2D Ex ta/tb IIIC T85°C IP65 De/Db

PROTECTION

EXPLOSION RELIEF VENT

— The Explosion Vent is a relief device that ruptures at a predetermined pressure to allow the fireball and the explosion pressure to be routed to a safe area.

The flameless Vents are designed to quench the flames front and relieve the pressure. This vent is typically used in applications which cannot be vented to a safe area, outside.

ISOLATION FLAP VALVE

— Isolation Systems are designed to detect an incipient explosion and react to minimize the risk for the deflagration to expand to other equipment connected to the same network process.

This system provides a mechanical barrier which isolates the deflagration event.

CHEMICAL EXPLOSION SUPPRESSION SYSTEM

 The Chemical Explosion Suppression System is designed to detect the buildup
of pressure during an explosion and discharge an explosion suppressant into the
enclosed space, before destructive pressures develop. The suppressant interferes with the reaction of the explosion, removing the heat from the deflagration front flames and lowering its temperature, below the level needed for the cumbustion. The explosion suppressant also creates a barrier among the unburnt combustible particles to prevent any further heat transfer.

32

PRESSURE DETECTOR

It detects the pressure difference inside the chamber and activates the suppression system.

CO2 EXTINGUISHING SYSTEM

— The sensor tube can be easily installed directly in the volume to be protected where the fire could start. When in service, the tube is pressurized with dry nitrogen at 16 bar. The dynamics of pressurization makes the tube more reactive to the heat. If flames occur, the heat of the fire bursts the sensor pipe under pressure, in its hottest point (about 110 ° C).
The sudden depressurization of the tube activates a special differential valve and instantly submerges the affected area with the CO2 extinguishing agent. The fire is quickly put down immediately after the start, reducing damage and downtime to a minimum.
